

DDL[®] MAM-R

Installation guide for casing end seal (multiple version / red)

- Clean the surface of the carrier pipes and the cable conduit and remove loose surface parts and protruding impurities if necessary.
Caution: Not-deburred cable conduit ends can damage the casing end seal.
- It might be necessary to fix the position of the carrier pipes in the cable conduit.
- Pull the casing end seal over the carrier pipes in direction of the cable conduit until the end seal coupling at the side of the cable conduit sits on the cable conduit completely.
- Position the tightening straps provided on each coupling of the carrier pipe opening and the cable conduit so that they sit in the middle of the couplings. Securely tighten the straps.
- If there are 2 tightening straps per end seal coupling included in the delivery, position them in the middle of the pipe coupling.

The purchaser of the DDL casing end seals is responsible for its suitability for use and for all damages (immediate or consequential) resulting from improper installation.
